Training V7 Report: Diagnostic Test (Feature Validation)

Overview

This report documents the results of Phase 3, Version 7 (Diagnostic). Following the repeated failures of V1-V6 (which never exceeded 33% accuracy), we formulated a new hypothesis: **"Feature Starvation."**

Hypothesis: The previous models failed because we used only 7 manually calculated angles. We hypothesized that providing the **Full 3D Skeleton (99 features)** would allow the LSTM to "see" critical missing details (wrists, hips, bat position).

Objective: Run a controlled diagnostic test on just **2 distinct shots** (Cover Drive vs. Pull Shot) to see if the new 99-feature dataset could achieve high accuracy (>85%).

Dataset & Pre-processing

- **Dataset Source:** Cleaned Kaggle Dataset (Subset).
- **Classes:** 2 (cover, pull).
- **Feature Shape:** (50, 99) — (50 frames, 33 landmarks × 3 coordinates).
    - *Note:* This includes X, Y, and Z coordinates, centered at the hips (0,0).
- **Total Samples:** 50 Test samples (Balanced).

Model Architecture

- **Type:** Bidirectional LSTM (Simplified for Diagnostic).
- **Input:** (50, 99)
- **Architecture:**
    - Bidirectional(LSTM(128))
    - Dropout(0.4)
    - Dense(32, 'relu')
    - Dense(2, 'softmax')

Final Evaluation Results

Overall Test Accuracy: 86.00%

(Baseline Random Guessing: 50.00%)

Classification Report

Shot Type	Precision	Recall	F1-Score	Support
Cover Drive	78%	**100%**	0.88	25
Pull Shot	**100%**	72%	0.84	25
Weighted Avg	**0.89**	**0.86**	**0.86**	50

Key Findings & Analysis

1. **Hypothesis CONFIRMED:** The jump from ~30% (V6) to **86% (V7)** proves definitively that **Feature Starvation** was the root cause of all previous failures. The model can now "see" the biomechanics.
2. **Perfect Precision (Pull Shot):** The model achieved **100% Precision** on Pull Shots, meaning every time it guessed "Pull," it was correct.
3. **Perfect Recall (Cover Drive):** The model achieved **100% Recall** on Cover Drives, meaning it successfully identified *every single* cover drive in the test set.
4. **Confusion Analysis:** The 7 mistakes (Pull shots misclassified as Cover) are likely due to "flat bat" pull shots that biomechanically resemble a drive when only looking at the skeleton.

Conclusion

This diagnostic test successfully validated the **V7 Architecture (99 Features + LSTM)**. It provided the "Green Light" to proceed with training the full Multi-Class Shot Classifier (V8) and the Binary Error Classifier.

Status: PASSED.
